

TECHNICAL BULLETIN TB-54

Issue No. 01
Date 16/01/07
Author RCB

**Application: All Mercedes “A” class
A140, A160, A190**

Models fitted with MSM2 engine management system

The starter motor supplied requires a full 12V battery voltage to energise the solenoid.

Some of the Mercedes “A” class vehicles were fitted with the MSM2 engine management system, which does not feed 12V to the solenoid terminal - it requires a different type of solenoid and starter.

Although the starters look very similar, they are not interchangeable – serious damage to the ECU can be caused by installing and connecting the wrong starter.

Check the system before installing the starter.

**The supplier cannot be held responsible
for subsequent damages resulting from
ignorance of this warning.**
